### LED PHOTO-FACIAL CLIENT RELEASE AND INFORMED CONSENT FORM

\*Please read the following information and acknowledge that you understand and accept all provisions by signing below.

**Statement of Purpose:** Our intention is to inform you about Lumiere, educate you how to properly operate the Lumiere Photo-Therapie device and present you with any of the possible negative effects of Lumiere. The proper procedure to follow in the Lumiere Photo-Therapie session room will be clearly explained to you by a member of our staff. Please feel free to voice questions and concerns that you may have at any time to one of our trained staff members.

#### Lumiere Photo-Therapie Device Operator Instructions

- Follow instructions that are provided to you by the salon staff member.
- Lumiere Photo-Therapie sessions are limited to one 20-minute session per 24-hour period.

#### Cosmeceutical Instructions

- As with all topically applied skincare products, use caution when applying products in the immediate area surrounding eyes.
- In the event that contact with eyes occurs, immediately flush with cool water.

#### Not Intended For Children, Pregnant Women or Individuals With Light Sensitive Conditions

- Lumiere is based on core technology that has been extensively assessed during clinical studies over 15 years. No significant adverse reactions have been reported using this technology. The safety of this technology for the treatment of children, pregnant women and clients with light sensitive conditions has not been confirmed. An alternative treatment is recommended for these clients.

#### Eyewear During Lumiere Photo-Therapie Session

- The output of the Lumiere Photo-Therapie device is less than the maximum recommended Maximum Permissible Exposure to Incoherent Optical Radiation (MPE). Nevertheless, it is prudent to ensure that your eyes are closed throughout the session. The frequency of light wave emitted by the Lumiere Photo-Therapie device is within the visible light spectrum and poses no threat of retinal burn or any other eye injury, however, due to the brightness of the light you may wish to use eyewear.
- Some clients that are extremely sensitive to bright light and that do not use eyewear may experience slight discomfort including a temporary mild headache.

#### Photosensitivity

- Photosensitivity can also be caused by: certain perfumes or plant materials such as St. Johns Wart in contact with the skin; metabolic disorders such as Porphyria and other light induced rashes (Porphyria is a severe light induced allergy and Lumiere is not recommended for clients with this condition); Autoimmune diseases such as Lupus Erythematosus; and Albinism.
- Certain medications and substances can cause an adverse reaction in the skin when exposed to light. The substances may be oral or topical. A listing of such substances is provided in our salon and is available for your review.
- **DO NOT TAN THE SAME DAY YOU HAVE AN LED PHOTO-FACIAL.**
- **Please list all medications that you are currently taking:**

---

#### Acknowledgement

By my signature below, I acknowledge that I have read and understand the contents of this form. I have been provided with instructions for the proper use of Lumiere and will use at my own risk. I hereby release the owners, operators, distributors and manufactures of Lumiere from any damages that I might incur during the use of Lumiere at this facility.
